Category: OsmocomBB Firmware	
Target version:	
Resolution:	Spec Reference:
Description FCDEV3B (stands for "FreeCalypso development board, triband") is a GSM mobile station development board based on legendary TI Calypso chipset. In 2017 Mychaela Falconia has announced that the firmware part of OsmocomBB was extended with support of this board, but the code so far was not merged to the upstream. The modified source code archive can be downloaded from: ftp://ftp.freecalypso.org/pub/GSM/FreeCalypso/obb-fcmodes-r1.tar.bz2
