Target version:	
Spec Reference:	
Description The remote SIM functionality enables to use SIMtrace 2 to do things like functional testing of smartphones, for instance to do regression testing or to fix bugs on the free software code that talks to its modem. In such permanent installation setup, it would be better to be able to permanently screw it (through standoffs, screws, and bolts). As for keeping the smartphone in place, it's probably trivial to do that with a smartphone case.
