Description I installed GNUradio, and its GUI, gnuradio-companion, using pybombs. The use of pybombs for installation requires that one set up a prefix point, or directory, so that all installation files are under that directory. When I use the method outlined in https://osmocom.org/projects/gr-osmosdr/wiki/GrOsmoSDR , many files, including the RTL SDR Source block file, are installed, but I do not know which files, aside from (obviously) the block file, should be copied from the default installation locations to a directory under my prefix point for the blocks to actually work. Having copied only the RTL SDR Source block file, and attempting to execute the GRC flowgraph (which contains that one block), I am greeted with the error "Import Error: No module named osmosdr" What do I do?
