I’m looking into the current series of OBS failures. Failures on x86_64 and i568 are sporadic timeout or i/o errors in OBS that we can’t do much about.

For armv7l debian9, there are two failing packages:

- libosmocore: exec_test is failing
- osmo-usecups: ‘implicit declaration of function ‘osmo_signalfd_setup’
  - probably a follow-up error of the outdated libosmocore

Details about the libosmocore error:

The check was introduced in: [https://gerrit.osmocom.org/c/libosmocore/+/16619](https://gerrit.osmocom.org/c/libosmocore/+/16619)

For some reason, the ‘env | grep MAHLZEIT 1>&2’ command produces an empty stderr on that system instead of "MAHLZEIT=spaet". (The test sets the environment variable first.)

However, the patch has been merged in December, and this error has only started to show up in OBS builds on 2020-04-19.
